

JavaScript Practice 1.3

Subject: Arrays

Created By: Pritey Mehta

1. Create an array of numbers and write code to calculate the sum, average, and maximum value of the numbers in the array.
2. Create an array of strings and write code to find the longest string in the array.
3. Create an array of objects and write code to sort the objects based on a specific property (e.g., name, age, etc.).
4. Write a function that takes an array as an argument and returns a new array with duplicates removed.
5. Write a function that takes two arrays as arguments and returns a new array that combines the elements of both arrays, removing any duplicates.
6. Create an array of strings and write code to sort the strings in alphabetical order.
