# JavaScript Practice 2.2

Subject: Functions
Created By: Pritey Mehta

Case 1:

Create an application to create a calculator. Use **named function** for this. Application page will look like the following image.

Case 2:

Create an application that calculate the BMI of user. Mass & height will be taken dynamically from the user input and output will be displayed on the label.

BMI formula: mass / height ^ 2

(Mass in kg and height in meter)

Case 3:

Create a function that returns the array of each letter passed as string via argument.

Example:

Input: "abc"

Output: [a,b,c]

Case 4:

Create a function that calculate age based on the date of birth. "Date of birth" will be passed via function argument.
